CMPT 353 asn 3

First i wrote the code for the simple html and server
and then tested the thing by making it live in the host
server. then added some new features for the sql which
i created table in sql and then accessed the data
through the server.js and then wrote the functions for
the asscending and descending order and added the
functions calls to the buttons and then started the
testing. at first got error in testing for he ascendong
and descending buttons which displayed the contents of
the table in view display foe just a fraction of
second.
then later i realized thet they were stored in a
container which was inturrupting them and removed it
and then put then directly to the body which solved the
error and save my work. now the code runs perfectly
well as asked for.
